Planning

User Flows

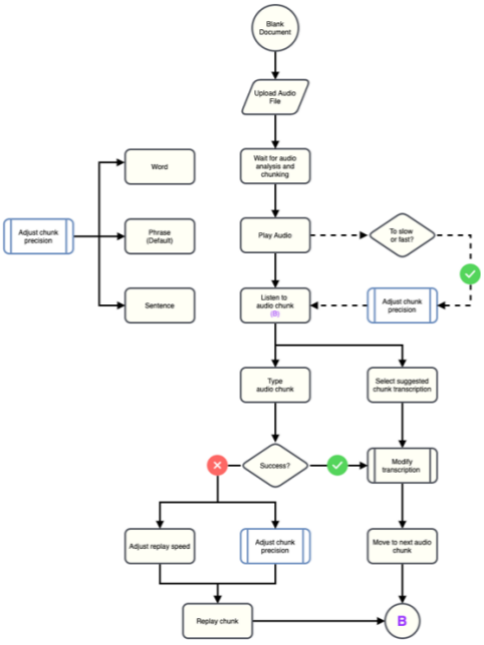

Diagram of how I intend users to navigate the experience of completing each task. Transcribing, selecting quotes, and adding codes are the main task of the application.

Adding code to quotation

Selecting and adding quote

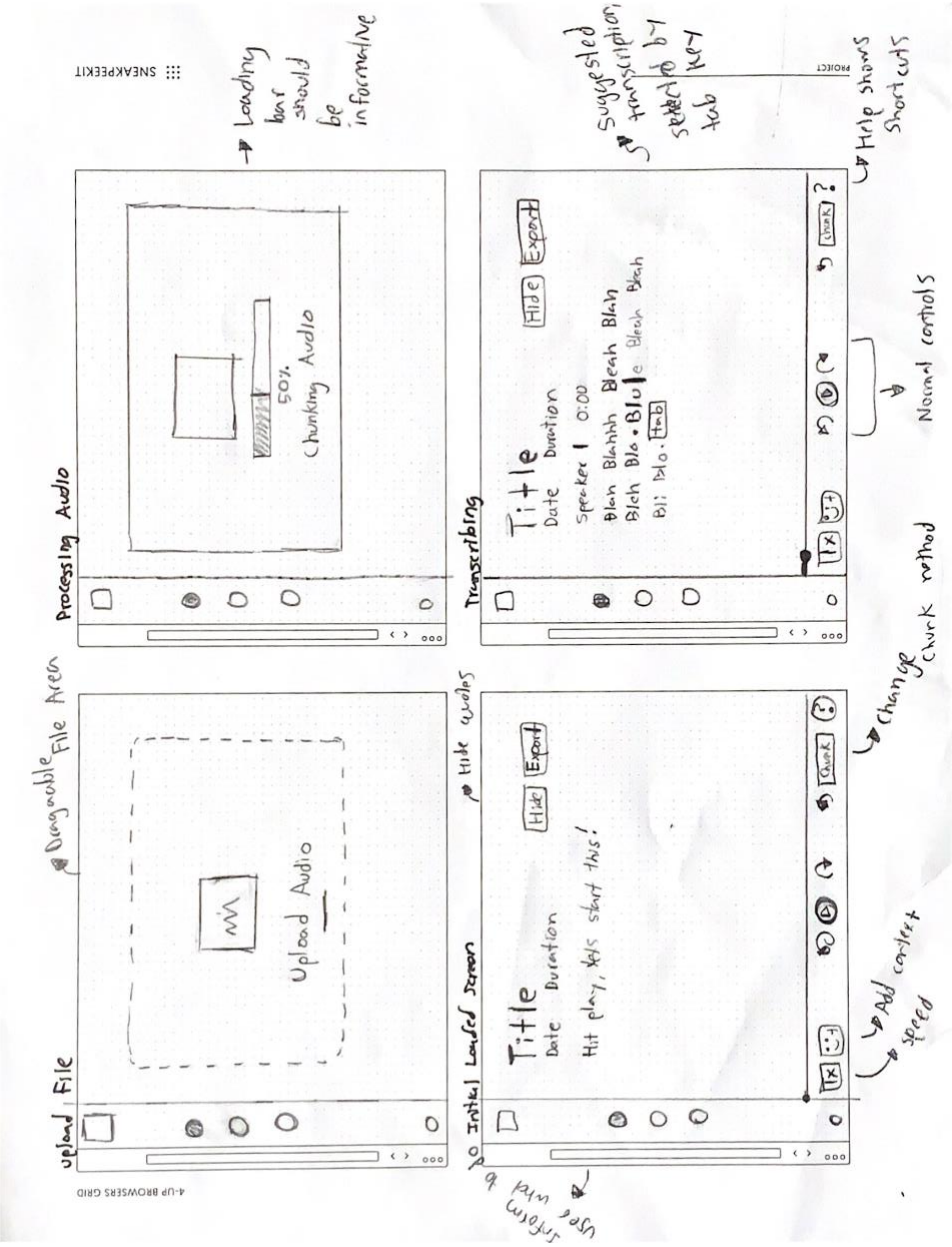

Transcribing Audio

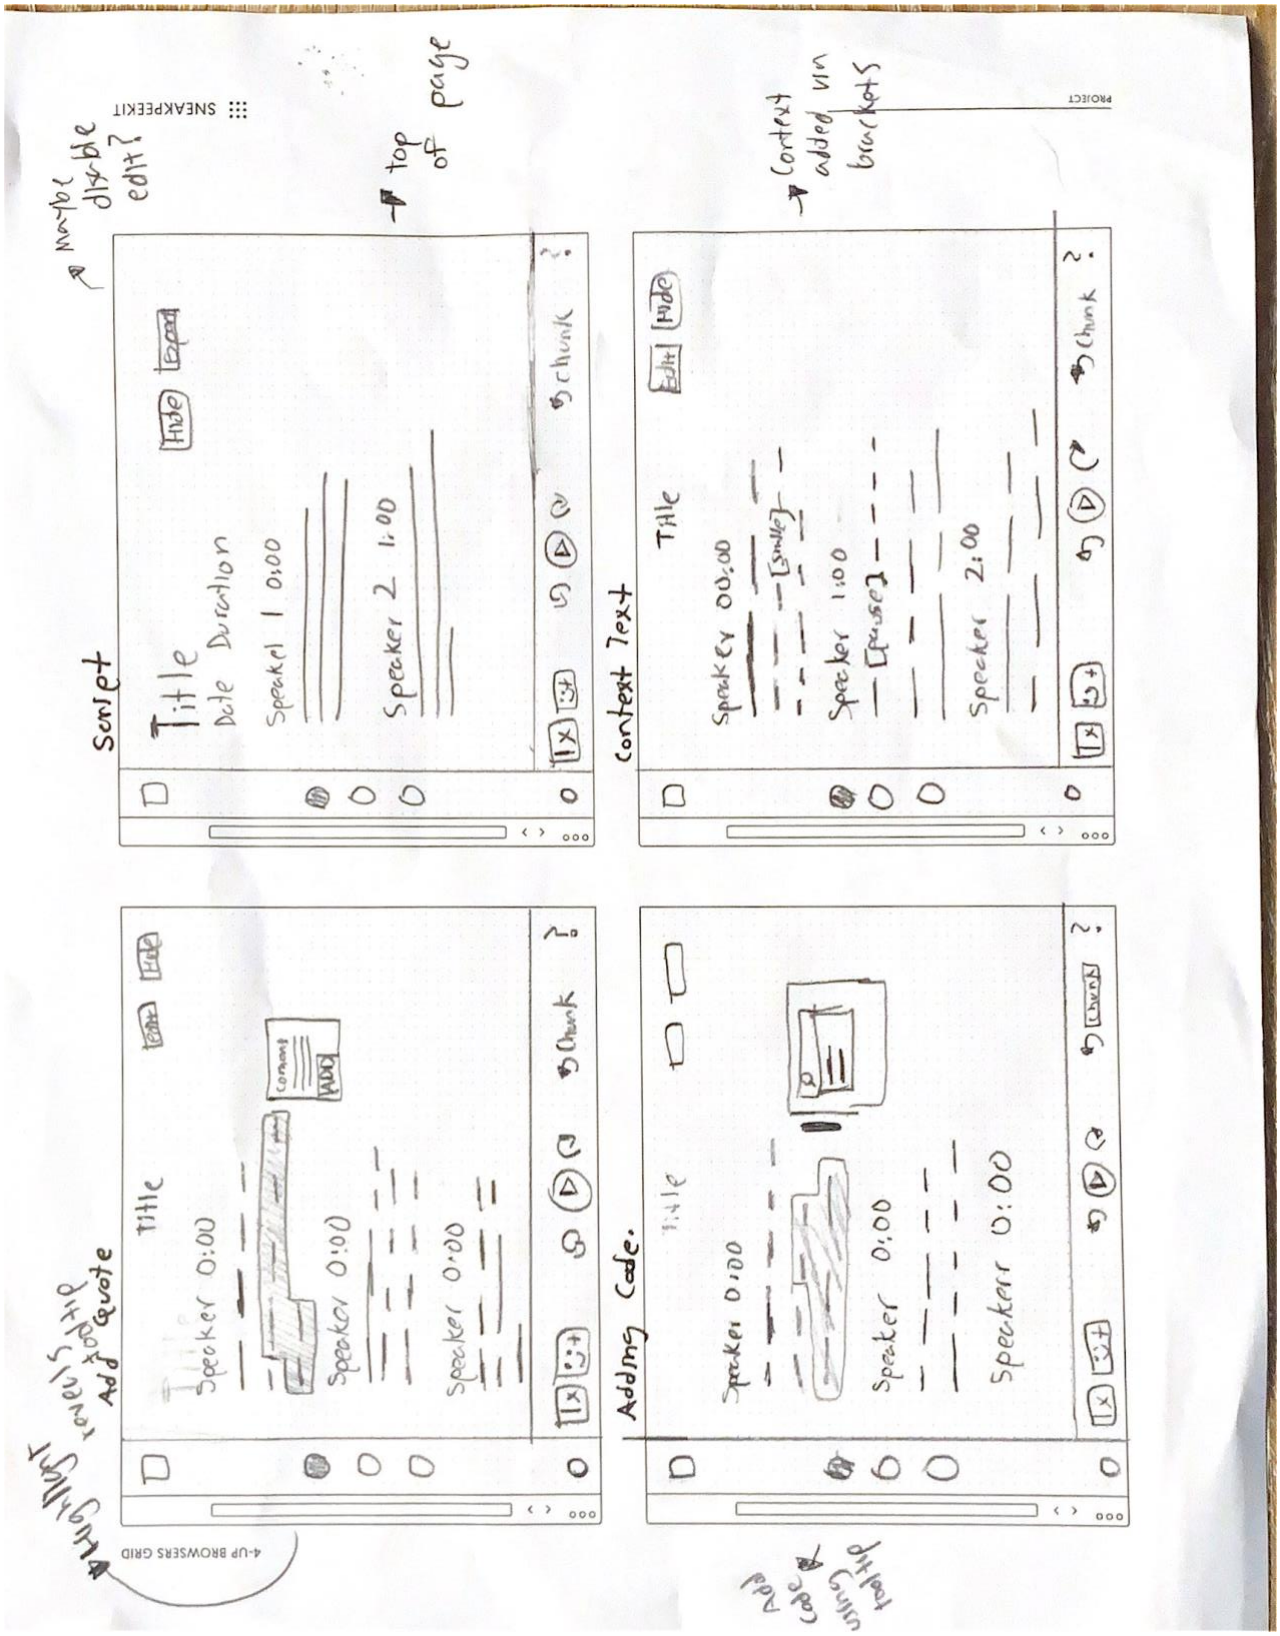

Link to User Flows

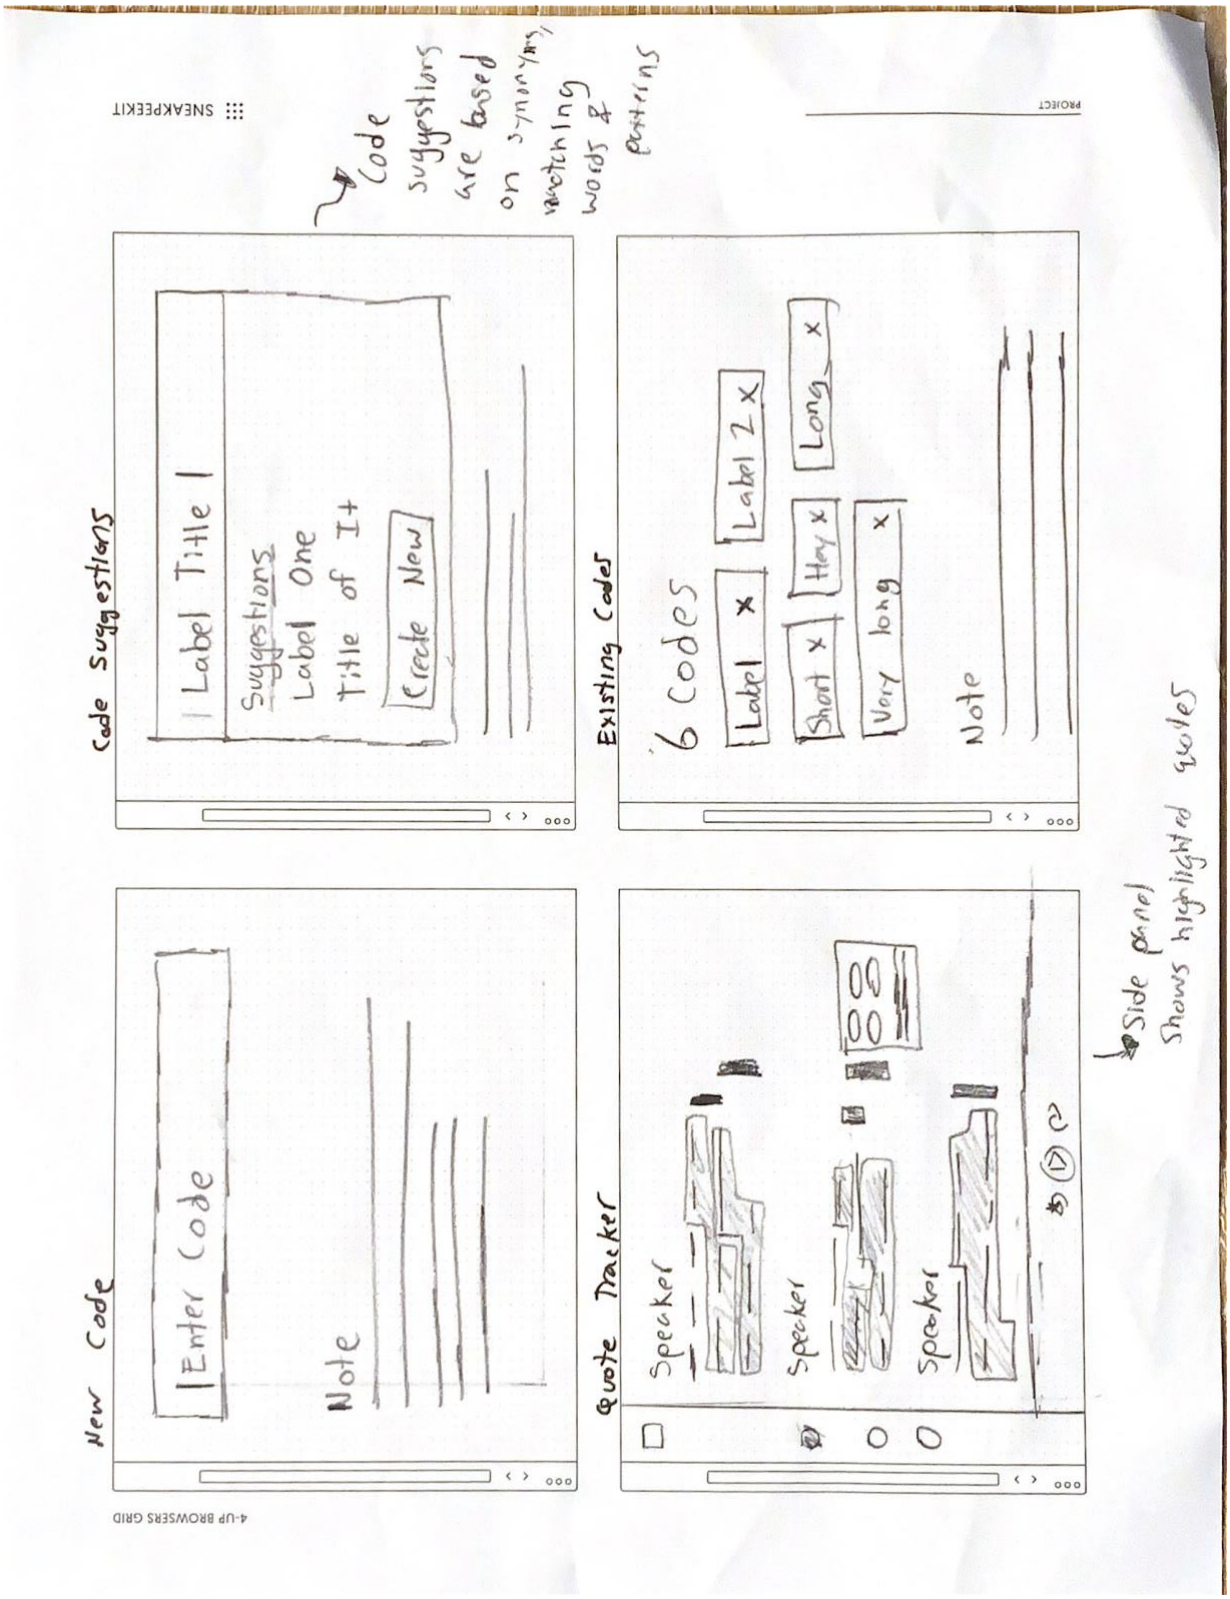

The link contains 6 user flows. 2 flows for each task depicting the existing user experience and the new proposed experience.

Sketches

Initial sketches used to design the paper prototype and quickly iterate through ideas.

Low-Fi Prototype

Paper prototype used to test the applications UX with users. During the testing session, I will play out the role of the computer and insert/remove UI elements.

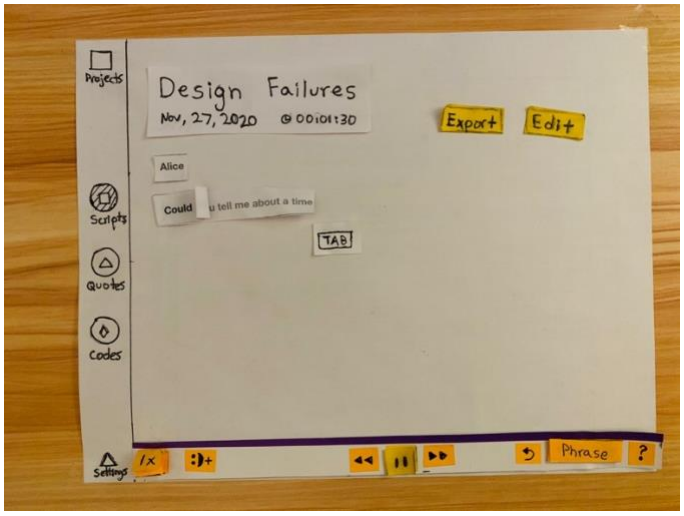

Quote Selection

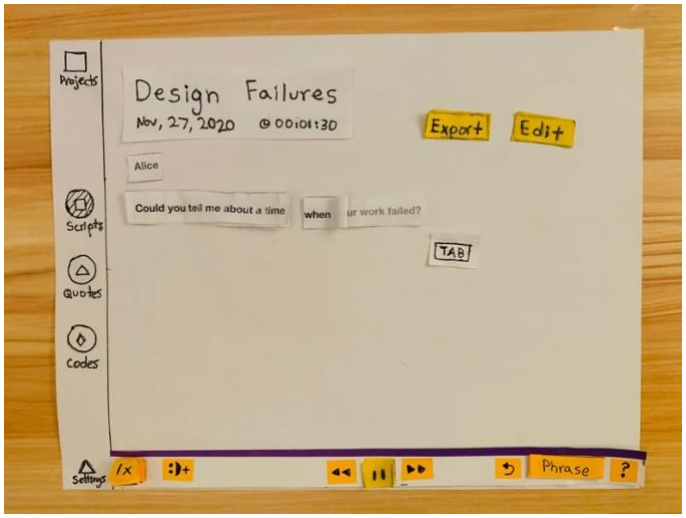

Add Code to Quote

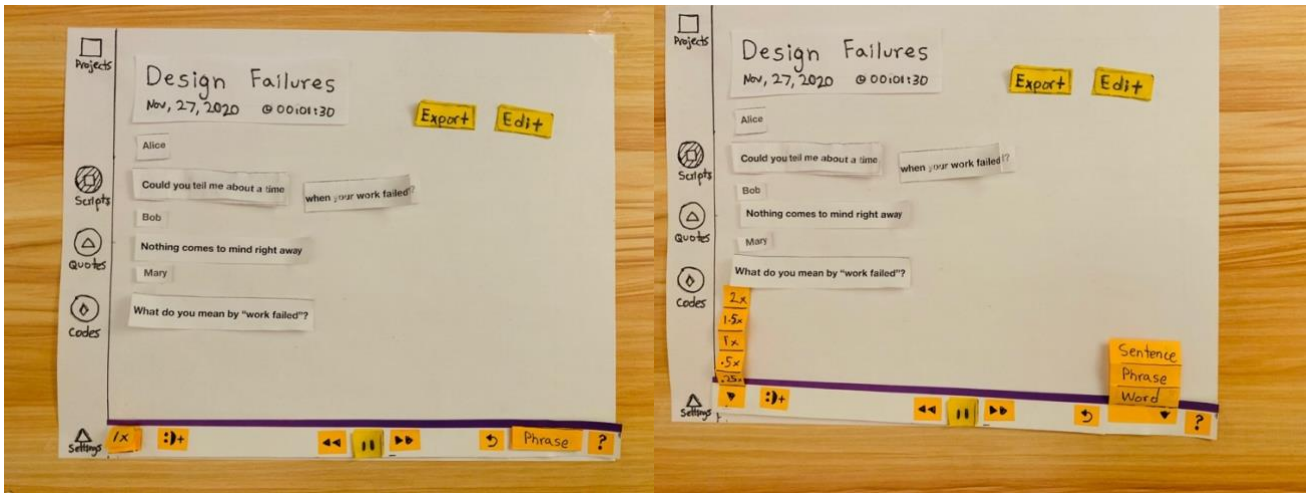

Initial Screen with loaded MP3 file

User Testing

Brief

Today you will be participating in a user testing session to test a paper prototype for an application that helps UX researchers process their qualitative data.

The Following brief describes the application in more detail.

Collecting qualitative research is an important part of the human-centered design process. This type of data can be collected using several techniques such as interviews, focus groups, or questionaries. After collecting data, researchers must process and clean the data before it is analyzed. Processing data can often be a time-intensive part of the research process. It requires carefully transcribing audio files, rewinding and slowing down audio, isolating important quotes, and adding codes to the text. This process is crucial but slow and repetitive.

The application you are about to test focuses on helping UX researchers and designers actively transcribe qualitative data and then organize it into quotes/labels. The audio is transcribed in chunks or sections to facilitate the process. A code is a short description (couple words) that summarizes a theme found in the research.

Before we begin, I want to ask you if you consent to this session being recorded for research purposes.

Any further questions about the application or this session?

Task

Task 1: You just finished interviewing someone about the design process, you now want to start analyzing this data! Transcribe the interview audio file located in your file system.

Task 2: Oh no! you are unsure what the previous words you heard said. Use the word chunking setting to reverse the clip by 3 words.

Task 3: Transcribing was easy, let's begin organizing our script. Select the following text and assign codes to them.

- "The joke is even V1, V2, V3, V-3-Final... It's an iterative process" with codes PROCESS and DESIGN
- "Failure means you didn't meet the bar, or you don't understand the requirements and you just peace out." with the code STEP
- You realized that 2 of your codes are very similar, delete the similar code and replace it with an existing code.

Questions

Short questions to gauge effectiveness of features:

Did you understand how to transcribe an audio file?

Where the transcription suggestions helpful?

Do you understand the three audio chunking modes (word, phrase, sentence)?

Did you understand how to create quotes and add codes?

Participants

Participant A

- 20-year-old female
- Currently working as a design strategist for a non-profit
    - Conducts over the phone interviews
    - Analysis phone calls
    - Translates information into campaigns, advertisements, and posters.
- Testing Conditions: Friday Morning via Zoom.

Participant B

- 21-year-old male student
- Experience with software engineering and business
    - Analysis business requirements of a product
    - Understands the technical challenges of building tech products
    - Basic understanding of relevant computer science concepts: Machine learning, Language processing and Artificial Intelligence.
- Testing Conditions: Friday Afternoon via Zoom.

Observations (Link to Recordings)

Participant 1

Task 1:

- Found it useful that the application informed her of the file upload status
- Based on the file name she deduced that the file was successfully uploaded
- Was confused by the lack of instructions after loading the file (Computer Error)
- Started talking about colors and design considerations (Maybe I should have not had colored buttons)
- Confused at how the computer knew the speaker names (Should have labeled them without names)
- After typing the first phrase, the user understood that the application provides a suggestion
- The user was excited and amazed when she realized that she could press tab to select the transcription suggestions.
- After learning about the suggestions, she continued using the feature. This is how she used it
    1. Read suggestion
    2. Decide if suggestion is correct
        a. Is suggestion correct?
            i. Press tab
        b. Is suggestion not correct?
            i. Press tab
            ii. Edit incorrect part
    3. Repeat Step 1
- Used suggestions and manual editing to quickly fix transcription errors.

Task 2

- Unsure about the definition of word chunking
- Initially pressed reversed with phrase chunking selected. The user was confused and laughed about the situation. Afterward, she pressed reversed once and was confused as to why the audio was reversed to the start of the sentence.
- They pointed out that they have already heard and read the audio since its shown in the interface. This made it difficult to complete a task that appears complete (Prototype error)

- Commented on the design of the menu, they didn't know it was a menu because it wasn't labeled correctly.
- After figuring out how to reverse by word chunking, they commented on how calling chunking a measure would be a better label for the feature.

Task 3

- Easily selected text
- Surprised at the pop-up tooltip
- Understood how to add a new code. Pressed add code, then typed code, then added the code.
- Knew how to close the popup
- Did not follow the suggestion for the code STEP

Notes from interview responses:

- Initially, they didn't understand the suggestion and tab feature. But after learning about it, they preferred using it.
- There's a small learning curve for users who are trying to understand the concept of audio chunking/measure.
- Make audio chunking measure features more discoverable.
- Would like an indicator of the quote that is being attached with codes.
- Maybe onboard users on how audio chunking works?

Participant 2

Task 1:

- Had no issues with uploading a file
- Unsure where to type the text (More of a prototype and testing medium constraint)
- The user did not use the transcription suggestions and instead continued to type
- Thought that tab will go to the next audio chunk, not necessarily choose the suggestion
- Believed that when the audio is played the text turns bold, didn't understand suggestion mechanism.

Task 2

- Understood that there is a sub-menu for changing the chunking measure
- After changing to the word measure, the user proceeded to click on the reverse button three times.
- The user was a bit confused by what happened afterward and unsure of their next action
- Pressed the reverse button and was still confused. I interjected by letting him know that he still needs to transcribe the audio. Afterward, he understood and decided to press the chunking reverse button three times and typed out the missing words.

Task 3:

- Dragged cursor across the text and highlighted it, then clicked on codes (sidebar).
- I informed the user that the whole interaction occurs on the same screen
- Right clicked on the highlighted text and clicked add code. Afterward typed the code and added it.
- Clicked on the quote, then selected the step code, then added the code PROCESS

Notes from interview responses:

- A tooltip would be helpful for some of the niche features of the application.
- The concept of reversing made sense but believes that the phrase measure is a bit vague.
- How do you define a phrase? It's easy to measure a word or a sentence but no phrase
- Had no difficulties creating quotes and adding codes since it follows web tagging standards.
- A bit confused about the codes nav menu, believed it was used to create codes.
- Adaptive precision selection should be an opt-in feature since it might be confusing for novice users.

Iteration

Key insights

- Consider adding an onboarding flow. Some of the features such as adaptive precision highlighting and audio chunking measures are unfamiliar to most users.
- Make the audio measure feature more discoverable. Currently it is hard for users to find it. Additionally, improve the labeling of the feature.
- Add tooltips, a standard web interface element
- It might be difficult to track which quote is being edited, so consider only highlighting the selected quote.
- Some users might not be aware of the transcription suggestions, consider minding a way to emphasize that feature.
